

BUSINESS REQUIREMENTS DOCUMENT

E-Commerce Checkout & Payment System

Project "SwiftCart Checkout"

Document Title	Business Requirements Document – E-Commerce Checkout & Payment System
Project Name	Checkout & Payment Experience Revamp (Project "SwiftCart Checkout")
Document Version	1.0 (Draft)
Date	August 6, 2026
Prepared By	Ujwala — Business Analyst
Business Sponsor	VP, E-Commerce
Status	Draft — Pending Stakeholder Review

Table of Contents

1. Document Version History

Version	Date	Author	Description of Change
0.1	Jul 22, 2026	Ujwala	Initial draft created
1.0	Aug 6, 2026	Ujwala	Incorporated stakeholder feedback; ready for review

2. Executive Summary

SwiftCart's online checkout process currently has a cart abandonment rate of 68%, well above the industry benchmark of 55–60%. Customer feedback and support ticket analysis point to a checkout flow that is too long, offers limited payment options, and frequently fails to process payments on the first attempt.

This project will redesign the checkout and payment experience to reduce friction, expand payment method coverage, and improve reliability — with the goal of increasing conversion and reducing payment-related support volume ahead of the Q4 festive sale period.

3. Business Background / Problem Statement

Over the past two quarters, the E-Commerce division has seen checkout abandonment climb steadily while competitor platforms have introduced one-click and multi-modal payment options. Customer support has logged a rising number of tickets related to payment failures and an overly long checkout process. The business case for this initiative is to modernize checkout to remain competitive and to capture revenue currently being lost to abandonment.

4. Business Objectives

- Reduce checkout abandonment rate from 68% to 55% within 3 months of launch.
- Expand supported payment methods to include UPI, net banking, and digital wallets.
- Reduce average checkout completion time from 3.5 minutes to under 2 minutes.
- Reduce payment failure/retry rate from 9% to under 4%.
- Reduce checkout-related customer support tickets by 30% within 2 months of launch.

5. Project Scope

5.1 In Scope

- Redesign of the checkout flow (cart → shipping → payment → confirmation)
- Integration with card, UPI, net-banking, and wallet payment gateways

- Promotional/discount code validation and application logic
- Order confirmation notifications (email and SMS)
- Saved payment methods and saved address management for registered users

5.2 Out of Scope

- Post-purchase returns and refunds workflow (covered under a separate initiative)
- Loyalty/rewards points redemption (Phase 2)
- In-app checkout for the native mobile application (separate mobile BRD)
- Multi-currency and multi-language support (future phase)

6. Stakeholders

Name / Role	Department	Interest / Responsibility	RACI
VP, E-Commerce (Sponsor)	Business Leadership	Owens business case; approves budget and scope	Accountable
Head of Product	Product	Prioritizes features; signs off on requirements	Responsible
Business Analyst	Product/PMO	Elicits, documents, and validates requirements	Responsible
Engineering Lead	Technology	Assesses feasibility; owns technical design	Consulted
Payments/Finance Manager	Finance	Ensures compliance with payment regulations	Consulted
Customer Support Lead	Support	Provides feedback on recurring checkout complaints	Consulted
QA Lead	Technology	Validates that delivered solution meets requirements	Informed
Marketing Manager	Marketing	Aligns promotions/discount codes with checkout flow	Informed

7. Business Requirements

7.1 Functional Requirements

Requirements are prioritized using the MoSCoW framework (Must have, Should have, Could have, Won't have this phase).

ID	Requirement Description	Priority (MoSCoW)
----	-------------------------	-------------------

BR-01	The system shall allow a registered customer to check out using a saved default payment method with a single click.	Must have
BR-02	The system shall allow a guest (non-registered) user to complete checkout by entering shipping and payment details manually.	Must have
BR-03	The system shall support payment via credit/debit card, UPI, net banking, and at least one digital wallet.	Must have
BR-04	The system shall validate and apply promotional/discount codes at the checkout stage before payment is initiated.	Must have
BR-05	The system shall display a real-time order summary (items, quantity, taxes, shipping, discounts, total) before payment confirmation.	Must have
BR-06	The system shall send an automated order confirmation via email and SMS within 2 minutes of successful payment.	Must have
BR-07	The system shall allow customers to save multiple shipping addresses and select one during checkout.	Should have
BR-08	The system shall display estimated delivery date based on the selected shipping address and item availability.	Should have
BR-09	The system shall retain cart contents for logged-in users across sessions and devices.	Should have
BR-10	The system shall allow customers to split payment between a gift card/wallet balance and a card/UPI method.	Could have
BR-11	The system shall recommend one-click upsell/cross-sell items on the checkout review page.	Could have
BR-12	The system shall support checkout in multiple languages based on user locale preference.	Won't have (this phase)

7.2 Non-Functional Requirements

Category	Requirement
Performance	The checkout page shall load in under 2 seconds for 95% of users under normal load conditions.
Availability	The checkout and payment service shall maintain 99.9% uptime, excluding scheduled maintenance windows.
Security	All payment data shall be processed in compliance with PCI-DSS; no card data shall be stored on application servers.
Scalability	The system shall support at least 3x normal transaction volume during peak sale events without degradation.

Usability	Checkout shall be completable in 4 steps or fewer, and be fully responsive on mobile, tablet, and desktop.
Auditability	Every payment transaction shall be logged with a unique transaction ID for audit and reconciliation purposes.

8. Assumptions and Constraints

8.1 Assumptions

- Existing payment gateway contracts (card processor, UPI provider) remain in place and support the required APIs.
- Customer and order data will continue to reside in the current CRM/OMS systems; no data migration is in scope.
- Business stakeholders will be available for requirement walkthroughs and UAT sign-off within agreed timelines.

8.2 Constraints

- The solution must launch before the Q4 festive sale period, fixing the go-live date.
- The project budget is capped and does not include a new payment gateway procurement.
- The solution must comply with PCI-DSS and applicable data protection regulations (e.g., RBI guidelines on card data storage).

9. Risks

Risk	Impact	Likelihood	Mitigation
Payment gateway API changes delay integration	High	Medium	Early technical spike with gateway sandbox; buffer time in schedule
Scope creep from late-stage stakeholder requests	Medium	High	Formal change-request process; MoSCoW re-prioritization each sprint
Compliance sign-off delays launch date	High	Low	Engage compliance/legal team from project kickoff, not pre-launch

10. Success Criteria / KPIs

Metric	Baseline	Target (Post-Launch)
--------	----------	----------------------

Checkout abandonment rate	68%	Reduce to 55% within 3 months
Average checkout completion time	3.5 minutes	Reduce to under 2 minutes
Payment failure/retry rate	9%	Reduce to under 4%
Customer support tickets re: checkout	~450/month	Reduce by 30% within 2 months of launch

11. Approval

This document requires sign-off from the stakeholders below before requirements are baselined and development planning begins.

Name	Role	Signature	Date
	Business Sponsor (VP, E-Commerce)		
	Head of Product		
	Engineering Lead
